Patent Claims

1. Apparatus for determining and/or monitoring the volume, and/or mass, flow rate of a medium (4) flowing through a containment (2) in a streaming direction (S), comprising at least one ultrasonic transducer (5, 6), which emits and/or receives ultrasonic measuring signals, and a control/evaluation unit, which determines the volume, and/or mass, flow rate of the medium in the containment on the basis of the ultrasonic measuring signals according to the travel-timedifference principle or according to the Doppler principle, characterized in that

associated with the control/evaluation unit (11) is at least one component of high power uptake and

15 the control/evaluation unit (11) is embodied such that the component (12) of high power uptake is operated intermittently in a measuring phase and in an idle phase, wherein the component (12) is activated in the measuring phase, while the component (12) has a reduced power uptake, or is turned off, in the idle phase.

10

2. Device as claimed in claim 1,

characterized in that

the flow measuring device (1) is a clamp-on flow measuring device or a measuring device which can be placed within the containment (2).

25

30

3. Device as claimed in claim 1 or 2,

characterized in that

the component of high power uptake is an amplifier (13), an analog/digital converter (14), a microprocessor (15) or a logic chip (16).

4. Device as claimed in claim 1 or 3,

characterized in that

5

15

30

at least one component (17) having a switching function is provided, wherein the component (17) having the switching function activates, or deactivates, at least one component (12) of high power consumption.

- 5. Device as claimed in claim 3 or 4, characterized in that
- a mechanism for decreasing current consumption is integrated into the component (12) of high power takeup.
 - 6. Device as claimed in claim 4, characterized in that the component (17) having a switching function comprises a semiconductor switch (18).
 - 7. Device as claimed in claim 1, characterized in that

the time span between two successive measuring, or idle, phases of the component (12) of high power uptake and/or the duration of a measuring phase (t₂) and/or the duration of an idle phase (t₁) of the component (12) of high power uptake is/are predetermined.

- 8. Device as claimed in claim 1,
- 25 characterized in that

an input unit (19) is provided, via which the time span between two successive measuring, or idle, phases of the component (12) of high power takeup and/or the duration of a measuring phase (t_2) and/or the duration of an idle phase (t_1) of the component (12) of high power takeup is predeterminable.

9. Device as claimed in claim 1,

5

15

20

the control/evaluation unit (11) determines the travel time of the measuring signals on the basis of predetermined system and/or process variables and specifies the time span between two successive measuring, or idle, phases of the component (12) of high power takeup and/or the duration of a measuring phase (t_2) and/or the duration of an idle phase (t_1) of the component (12) of high power takeup, as a function of the determined travel time.

16

10 10. Device as claimed in one or more of the preceding claims, characterized in that

the control/evaluation unit (11) determines the travel time of the measuring signals on the basis of predetermined system and/or process variables, and the control/evaluation unit (11) predetermines the time span between two successive measuring, or idle, phases of the component (12) of high power takeup and/or the duration of a measuring phase (t_2) and/or the duration of an idle phase (t_1) of the component (12) of high power takeup, as a function of the determined travel time and as a function of the energy which is available.

11. Device as claimed in claim 1,

characterized in that,

associated with the control/evaluation unit (11) is an energy storage element (20), which is sized such that it can at least store the energy required in the measuring phase.
